NAME : NAVDEEP SINGH
SBID : SB20220194879

Get Started with Apex Triggers

Here's the code :

```
trigger AccountAddressTrigger on Account (before insert,before update) {

List<Account> acclst=new List<Account>();
  for(account a:trigger.new){
    if(a.Match_Billing_Address__c==true && a.BillingPostalCode!=null){
    a.ShippingPostalCode=a.BillingPostalCode;

    }

}
}
```

Bulk Apex Triggers

Here's the code :

```
trigger ClosedOpportunityTrigger on Opportunity (after insert, after update) {

    List<Task> taskList = new List<Task>();

    for(Opportunity opp : Trigger.new) {

    //Only create Follow Up Task only once when Opp StageName is to 'Closed Won' on Create
    if(Trigger.isInsert) {
      if(Opp.StageName == 'Closed Won') {
        taskList.add(new Task(Subject = 'Follow Up Test Task', WhatId = opp.Id));
      }
    }

    //Only create Follow Up Task only once when Opp StageName changed to 'Closed Won' on
Update
    if(Trigger.isUpdate) {
```

```
    if(Opp.StageName == 'Closed Won'
    && Opp.StageName != Trigger.oldMap.get(opp.Id).StageName) {
      taskList.add(new Task(Subject = 'Follow Up Test Task', WhatId = opp.Id));
    }
   }
   }

   if(taskList.size()>0) {
      insert taskList;
   }
}
```

Get Started with Apex Unit Tests

VerifyDate class :

```
public class VerifyDate {

 //method to handle potential checks against two dates
 public static Date CheckDates(Date date1, Date date2) {
  //if date2 is within the next 30 days of date1, use date2.  Otherwise use the end of the month
  if(DateWithin30Days(date1,date2)) {
   return date2;
  } else {
   return SetEndOfMonthDate(date1);
  }
 }

 //method to check if date2 is within the next 30 days of date1
 private static Boolean DateWithin30Days(Date date1, Date date2) {
  //check for date2 being in the past
       if( date2 < date1) { return false; }

       //check that date2 is within (>=) 30 days of date1
       Date date30Days = date1.addDays(30); //create a date 30 days away from date1
  if( date2 >= date30Days ) { return false; }
  else { return true; }
 }

 //method to return the end of the month of a given date
 private static Date SetEndOfMonthDate(Date date1) {
  Integer totalDays = Date.daysInMonth(date1.year(), date1.month());
```

```
    Date lastDay = Date.newInstance(date1.year(), date1.month(), totalDays);
    return lastDay;
  }

}
```

TestVerifyDate :

```
@isTest
public class TestVerifyDate
{
    static testMethod void testMethod1()
    {
        Date d = VerifyDate.CheckDates(System.today(),System.today()+1);
        Date d1 = VerifyDate.CheckDates(System.today(),System.today()+60);
    }
}
```

Test Apex Triggers

Here's the code :

RestrictContactByName :

```
trigger RestrictContactByName on Contact (before insert, before update) {

  //check contacts prior to insert or update for invalid data
  For (Contact c : Trigger.New) {
    if(c.LastName == 'INVALIDNAME') {  //invalidname is invalid
      c.AddError('The Last Name "'+c.LastName+'" is not allowed for DML');
    }

  }

}
```

TestRestrictContactByName :

```
@isTest
private class TestRestrictContactByName {

   static testMethod void  metodoTest()
   {

      List<Contact> listContact= new List<Contact>();
      Contact c1 = new Contact(FirstName='Francesco', LastName='Riggio' ,
email='Test@test.com');
      Contact c2 = new Contact(FirstName='Francesco1', LastName =
'INVALIDNAME',email='Test@test.com');
      listContact.add(c1);
      listContact.add(c2);

      Test.startTest();
         try
         {
            insert listContact;
         }
         catch(Exception ee)
         {
         }

      Test.stopTest();

   }

}
```

Create Test Data for Apex Tests

Here's the code :

RandomContactFactory class :

```
//@isTest
public class RandomContactFactory {
   public static List<Contact> generateRandomContacts(Integer numContactsToGenerate, String
FName) {
      List<Contact> contactList = new List<Contact>();

      for(Integer i=0;i<numContactsToGenerate;i++) {
         Contact c = new Contact(FirstName=FName + ' ' + i, LastName = 'Contact '+i);
         contactList.add(c);
         System.debug(c);
      }
      //insert contactList;
      System.debug(contactList.size());
      return contactList;
   }

}
```

Use Future Methods

Here's the code :

```
public class AccountProcessor {
   @future
   public static void countContacts(List<Id> accountIds){
      List<Account> accounts = [Select Id, Name from Account Where Id IN : accountIds];
      List<Account> updatedAccounts = new List<Account>();
      for(Account account : accounts){
        account.Number_of_Contacts__c = [Select count() from Contact Where AccountId =:
account.Id];
         System.debug('No Of Contacts = ' + account.Number_of_Contacts__c);
         updatedAccounts.add(account);
      }
      update updatedAccounts;
   }

}
```

test class///

```
@isTest
public class AccountProcessorTest {
   @isTest
   public static void testNoOfContacts(){
      Account a = new Account();
      a.Name = 'Test Account';
      Insert a;

      Contact c = new Contact();
      c.FirstName = 'Bob';
      c.LastName =  'Willie';
      c.AccountId = a.Id;

      Contact c2 = new Contact();
      c2.FirstName = 'Tom';
      c2.LastName = 'Cruise';
      c2.AccountId = a.Id;

      List<Id> acctIds = new List<Id>();
      acctIds.add(a.Id);

      Test.startTest();
      AccountProcessor.countContacts(acctIds);
      Test.stopTest();
   }

}
```

Use Batch Apex

Here's the code :

```
public class LeadProcessor implements Database.Batchable<sObject> {

    public Database.QueryLocator start(Database.BatchableContext bc) {
```

```
    // collect the batches of records or objects to be passed to execute
     return Database.getQueryLocator([Select LeadSource From Lead ]);
  }
  public void execute(Database.BatchableContext bc, List<Lead> leads){
     // process each batch of records
       for (Lead Lead : leads) {
          lead.LeadSource = 'Dreamforce';
       }
    update leads;
  }
  public void finish(Database.BatchableContext bc){
   }

}

test class//

@isTest
public class LeadProcessorTest {

    @testSetup
  static void setup() {
    List<Lead> leads = new List<Lead>();
    for(Integer counter=0 ;counter <200;counter++){
       Lead lead = new Lead();
       lead.FirstName ='FirstName';
       lead.LastName ='LastName'+counter;
       lead.Company ='demo'+counter;
       leads.add(lead);
    }
    insert leads;
  }

  @isTest static void test() {
    Test.startTest();
    LeadProcessor leadProcessor = new LeadProcessor();
    Id batchId = Database.executeBatch(leadProcessor);
    Test.stopTest();
  }
```

}

Control Processes with Queueable Apex

Here's the code :

```
public class AddPrimaryContact implements Queueable
{
   private Contact c;
   private String state;
   public  AddPrimaryContact(Contact c, String state)
   {
      this.c = c;
      this.state = state;
   }
   public void execute(QueueableContext context)
   {
       List<Account> ListAccount = [SELECT ID, Name ,(Select id,FirstName,LastName from
contacts ) FROM ACCOUNT WHERE BillingState = :state LIMIT 200];
       List<Contact> lstContact = new List<Contact>();
       for (Account acc:ListAccount)
       {
            Contact cont = c.clone(false,false,false,false);
            cont.AccountId =  acc.id;
            lstContact.add( cont );
       }

       if(lstContact.size() >0 )
       {
          insert lstContact;
       }

   }

}
```

test class///

```
@isTest
public class AddPrimaryContactTest
{
    @isTest static void TestList()
    {
        List<Account> Teste = new List <Account>();
        for(Integer i=0;i<50;i++)
        {
            Teste.add(new Account(BillingState = 'CA', name = 'Test'+i));
        }
        for(Integer j=0;j<50;j++)
        {
            Teste.add(new Account(BillingState = 'NY', name = 'Test'+j));
        }
        insert Teste;

        Contact co = new Contact();
        co.FirstName='demo';
        co.LastName ='demo';
        insert co;
        String state = 'CA';

         AddPrimaryContact apc = new AddPrimaryContact(co, state);
         Test.startTest();
           System.enqueueJob(apc);
         Test.stopTest();
    }
}
```

Schedule Jobs Using the Apex Scheduler

Here's the code :

```
public class DailyLeadProcessor implements Schedulable  {
   Public void execute(SchedulableContext SC){
      List<Lead> LeadObj=[SELECT Id from Lead where LeadSource=null limit 200];
       for(Lead l:LeadObj){
          l.LeadSource='Dreamforce';
```

```
            update l;
        }
    }
}

test class ///

@isTest
private class DailyLeadProcessorTest {
        static testMethod void testDailyLeadProcessor() {
                String CRON_EXP = '0 0 1 * * ?';
                List<Lead> lList = new List<Lead>();
            for (Integer i = 0; i < 200; i++) {
                        lList.add(new Lead(LastName='Dreamforce'+i, Company='Test1 Inc.',
Status='Open - Not Contacted'));
                }
                insert lList;

                Test.startTest();
                String jobId = System.schedule('DailyLeadProcessor', CRON_EXP, new
DailyLeadProcessor());
        }
}
```

Apex REST Callouts

Here's the code :
Class AnimalLocator

```
public class AnimalLocator{
    public static String getAnimalNameById(Integer x){
        Http http = new Http();
        HttpRequest req = new HttpRequest();
        req.setEndpoint('https://th-apex-http-callout.herokuapp.com/animals/' + x);
        req.setMethod('GET');
        Map<String, Object> animal= new Map<String, Object>();
        HttpResponse res = http.send(req);
            if (res.getStatusCode() == 200) {
```

```
        Map<String, Object> results = (Map<String,
Object>)JSON.deserializeUntyped(res.getBody());
      animal = (Map<String, Object>) results.get('animal');
        }
return (String)animal.get('name');
    }
}
```

AnimalLocatorTest

```
@isTest
private class AnimalLocatorTest{
    @isTest static void AnimalLocatorMock1() {
        Test.setMock(HttpCalloutMock.class, new AnimalLocatorMock());
        string result = AnimalLocator.getAnimalNameById(3);
        String expectedResult = 'chicken';
        System.assertEquals(result,expectedResult );
    }
}
```

AnimalLocatorMock

```
@isTest
global class AnimalLocatorMock implements HttpCalloutMock {
     // Implement this interface method
    global HTTPResponse respond(HTTPRequest request) {
        // Create a fake response
        HttpResponse response = new HttpResponse();
        response.setHeader('Content-Type', 'application/json');
        response.setBody('{"animals": ["majestic badger", "fluffy bunny", "scary bear", "chicken",
"mighty moose"]}');
        response.setStatusCode(200);
        return response;
    }
}
```

Apex SOAP Callouts

Here's the codec:

ParkLocator class/////

```
public class ParkLocator {
   public static string[] country(string theCountry) {
      ParkService.ParksImplPort  parkSvc = new  ParkService.ParksImplPort(); // remove space
      return parkSvc.byCountry(theCountry);
   }
}
```

ParkLocatorTest class//////

```
@isTest
private class ParkLocatorTest {
   @isTest static void testCallout() {
      Test.setMock(WebServiceMock.class, new ParkServiceMock ());
      String country = 'United States';
      List<String> result = ParkLocator.country(country);
      List<String> parks = new List<String>{'Yellowstone', 'Mackinac National Park', 'Yosemite'};
       System.assertEquals(parks, result);
   }
}
```

ParkServiceMock class /////

```
@isTest
global class ParkServiceMock implements WebServiceMock {
  global void doInvoke(
```

```
        Object stub,
        Object request,
        Map<String, Object> response,
        String endpoint,
        String soapAction,
        String requestName,
        String responseNS,
        String responseName,
        String responseType) {
      // start - specify the response you want to send
      ParkService.byCountryResponse response_x = new ParkService.byCountryResponse();
      response_x.return_x = new List<String>{'Yellowstone', 'Mackinac National Park', 'Yosemite'};
      // end
      response.put('response_x', response_x);
  }
}
```

Apex Web Services

Here's the code :

AccountManagerTest/////

```
@isTest
private class AccountManagerTest {

    private static testMethod void getAccountTest1() {
        Id recordId = createTestRecord();
        // Set up a test request
        RestRequest request = new RestRequest();
        request.requestUri = 'https://na1.salesforce.com/services/apexrest/Accounts/'+ recordId
+'/contacts' ;
        request.httpMethod = 'GET';
        RestContext.request = request;
        // Call the method to test
        Account thisAccount = AccountManager.getAccount();
        // Verify results
        System.assert(thisAccount != null);
```

```
        System.assertEquals('Test record', thisAccount.Name);

    }

    // Helper method
        static Id createTestRecord() {
        // Create test record
        Account TestAcc = new Account(
          Name='Test record');
        insert TestAcc;
        Contact TestCon= new Contact(
        LastName='Test',
        AccountId = TestAcc.id);
        return TestAcc.Id;
    }
}
```

AccountManager//////

```
@RestResource(urlMapping='/Accounts/*/contacts')
global class AccountManager {
    @HttpGet
    global static Account getAccount() {
        RestRequest req = RestContext.request;
        String accId = req.requestURI.substringBetween('Accounts/', '/contacts');
        Account acc = [SELECT Id, Name, (SELECT Id, Name FROM Contacts)
                       FROM Account WHERE Id = :accId];
        return acc;
    }
}
```
